DRAUGHT ANIMAL POWER TODAY

A DEVELOPMENT TOOL NOT SO DEVELOPED

1. Why discuss about draught animal power today?

Today, all over the world, hundreds of millions of working animals are engaged both in the transport and agriculture.

Although allowed for reasons, there are several cases to be investigated to improve the quality of the animal starters for draught work, and to mitigate their abuse and their condition in the transport sector.

2.3. Works performed

The draught animals are really useful for carrying the agriculture load and also in the agriculture sector. Increasing agricultural spending, funding, and other efforts such as the park area, tractors, and support for smallholders. In these, the role of draught animals is quite significant in the transport sector.

3. Factors that affect the use of animal traction

The use of the draught animal power is conditioned by several factors. Among them, the following factors are the most important:

3.1. Agronomic factors: soil texture and position of the land

The use of the draught animal power is conditioned by several factors. Among them, the agronomic factors are the most important. They include the type of soil, its texture, and its position. The soil texture affects the performance of the animal, as well as its ability to work in the field. The position of the land also affects the performance of the animal, as well as its ability to work in the field. The position of the land also affects the performance of the animal, as well as its ability to work in the field.

3.2. Environmental factors: weather and climate

Environmental factors, such as weather and climate, also affect the performance of the animal. For example, the animal may perform better in a cooler climate, as it will be more comfortable and able to work harder.

3.3. Social and economic factors

Social and economic factors also affect the use of animal traction. For example, the availability of alternative sources of energy, such as electricity, may encourage the use of animal traction. Similarly, the availability of alternative sources of power, such as tractors, may discourage the use of animal traction.

4. Vocational training and the diffusion of the best practices

Working with societies, at top with some more measures, remains expensive that can be offered only through tools and inventories. The client experience is necessary; however, the capacity of the client's capacity is limited to the poor financial resources available to them.
